Schwinn 2Z346/96 Pull designed by Jens Risom.
(Actual size.)

A page from a catalog for Schwinn Originals. At the top is the Schwinn Originals logo. Below it is a section titled "Schwinn Originals Quick Ship Program" with the subtext "In stock and ready to ship from our Arizona warehouse". There is a large area for product listings below this, which is mostly blank in the image shown.

1.

Schwinn Hardware – a story of dedication.

What Peter Schwinn started in 1932 as a workshop in Ober-Ramstadt, Germany (a small town near Frankfurt) using synthetic resin to make furniture handles and knobs, is today one of the leading European manufacturers of furniture hardware. Unlike most hardware companies, Peter Schwinn did not start the company as a blacksmith or metal workshop. He started it to make handles and knobs. For more than 85 years, the company has added many new materials and technologies: stainless steel, aluminum, die-cast zinc, injection-molded plastic, and wood are just a few. But no matter the advances, we always stayed true to one thing: our core-business of furniture hardware. It is this focus, along with our dedication to continuous improvement, that makes Schwinn Hardware a leader in the technology, design, manufacturing, and service of furniture hardware.

So, what do Schwinn Hardware and Schwinn bicycles have in common? Just the name. Ignaz Schwinn, a German who was born in 1860 in a town one hour southeast of Ober-Ramstadt, emigrated to the USA, and in 1895 founded Arnold, Schwinn & Company making bicycles in Chicago. Thirty-seven years later, Peter Schwinn started his furniture hardware company in Germany.

2.

Schwinn Hardware today – a world of daily innovation.

Today's furniture hardware business is global. Many, many companies from around the world compete on all levels from being the fastest, the cheapest, the hippest, the largest and the most experienced to whatever category a marketing person can come up with. At Schwinn, we have always believed that we are only in business because of our customers.

If we provide them with the best choice of relevant designs, industry leading manufacturing technology, superior quality, shortest possible lead times, great service, and competitive prices they will buy our products to make their furniture better. Furniture that our customers from around the world design, manufacture, build, install, restore, improve, or refresh.

A modern Schwinn factory (Ober-Ramstadt) today.

3.

Furniture hardware – functional decoration.

Even though the term "decorative hardware" is commonly used to describe the product category that handles and knobs are supposed to belong to, they are far more than just decorative. Warren Plattner, one of America's great architects and furniture designers, recalls that his employer and mentor, Raymond Loewy, the great American Industrial Designer, taught him: "it is worthwhile to pay attention to a very simple object." For over eight decades we have studied how fingers and hands – small and large, long nailed and thick, wet, or oily – can quickly or slowly grab, touch, feel, pull, push, open, and close drawers and doors, that are high, low, left or right. We designed and manufactured thousands of different designs and then started all over to come up with new and different approaches to solve the same problems. All the while the world of furniture changed and we helped make the changes better with new designs, new technology, new finishes, new materials, and new ways to work with our customers. At Schwinn, we've done our best when a customer loves the furniture that was made better by our hardware.

4.

Hardware in modern architecture and furniture design.

In his famous 1908 essay "Ornament and Crime", Adolf Loos (the Moravian born Austrian architect), explained that the relationship between object and ornament was a moral one based on the conviction that the ornament causes objects to go out of style and the effort that goes into the ornamentation is wasted and thus a crime. It was also the Moravians who built the town of Salem, now Old Salem, in North Carolina, and for those who have seen it, they will recall the lack of ornamentation in the buildings and furniture. "Ornament and Crime" was a major contribution to modernist architectural theory and a new era. It was the same era in which Peter Schwinn started his company.

Bauhaus architects like Breuer and Mies van der Rohe, as well as De Stijl architects like Rietveld, developed a new language for their furniture hardware. It was tool-like, functional, and without surface decoration. It was modern. Since then modern hardware design has taken many different directions. From Aalto's organic designs; Eames's utilitarian use of wire pulls; and Neutra's total elimination of hardware for built-in furniture to Girard's and Nelson's mid-century modern exuberant designs, to the post-modern whimsical Starck. But rarely has a specific handle or knob become known for the designer who designed it.

5.

Measurements – inches to millimeters.

Our standard of measure is the millimeter. When making small objects like handles and knobs, the millimeter is an appropriately precise unit. It can easily be converted into fractions of an inch, but that is a task we want to help you with. For that reason, we have included a conversion table so you can have it both ways. All measurements appear in the same order: width, height, and depth. Those measurements describe the handle or knob. Then there is "center to center" for the distance between taps. Sometimes there are C/C options for the same handle. Sometimes there is only one thread. In that case we have made sure by design that the knob will stay in place and will not accidentally twist.

6.

Materials: Zamak – 95% of the purest zinc. Plus aluminum, magnesium and copper in a standardized combination.

The invention of Zamak is a great American story of ingenuity. Developed and trademarked by the New Jersey Zinc Company in 1929, it solved two big problems: zinc itself is a brittle, low strength, and low hardness metal. However, the addition of three other metals transformed it and made it comparable (even superior) to other cast metals such as aluminum, magnesium, brass, and cast iron. In order to maintain the great mechanical properties of this alloy and to avoid the problem of zinc pest commonly caused by other zinc alloys at the time, New Jersey's research showed that they needed to use zinc that was 99.99% free of impurities.

To produce this never-before available grade they used a special refluxer during the smelting process to separate the wanted from the unwanted. The name Zamak itself is an acronym of the German words for the metals Zink (zinc), aluminium (aluminum), Magnesium (magnesium) and Kupfer (copper). Today there are several different Zamak alloys. With over 70% share, Zamak 3 is the most common Zamak used in the United States for hot chamber die-casting to make parts in industries ranging from cars and airplanes to household appliances. Schwinn hardware is made with Zamak 5 (European Standard EN 1774) which has 1% copper added to make it stronger and harder than Zamak 3.

7.

Materials: brass – zinc again and mainly copper (in many different combinations).

Brass is a generic term for a very broad range of copper-zinc alloys (not to be confused with bronze, which is a copper-tin alloy). Unlike Zamak, brass has no clear specification as to how much copper and zinc it has to contain. Different brasses consist of between 15 to 50% and more zinc, and 50 to 85% copper, sometimes additionally with some lead, tin, or aluminum.

This makes for very different qualities of materials that are all called brass. Decorative hardware made of brass is often stamped, forged, die-cast, or sand-cast, however, none of these techniques allows for the same complex shapes, close tolerances, and range of variation in thickness and economical finishing as Zamak. To protect the beautiful muted yellow color or to give brass hardware a chrome, nickel, or colored finish it is usually treated in similar ways as Zamak. It is then first the quality of the finish that determines how the part performs over time.

8.

Materials: aluminum – or is it aluminum alloy?

Aluminum – unlike Zamak or brass – is not an alloy; however, due to high shrinkage, aluminum is rarely ever used in its pure form to cast or extrude parts like decorative hardware. So again copper, magnesium, manganese, silicon, and zinc are added in various degrees to create the desired properties. There are many different aluminum alloys available and they all have different benefits, advantages, and usages. And even though aluminum is naturally corrosion-resistant, aluminum alloys are less so. That is why there is a “marine grade” aluminum.

Schwinn hardware is made with an aluminum alloy called Al Mg Si 0,5 (European Standard 3.3206). A good corrosion resistance material that we make even higher with our anodized finishes.

9.

Materials: stainless steel – it's the chromium that makes the steel corrode less (and shiny when polished).

Since the 19th-century it was known that adding chromium to steel (another alloy) gives ordinary steel a special resistance to corrosion. A process called passivation creates a layer of chromium oxide on the surface so thin that the metal is still lustrous, but thick enough to prevent the corrosion process to spread into the material. It is the same process that occurs on aluminum and titanium. A minimum of 11% of chromium in the steel is required. The more the better. Over 150 different grades of stainless steel are available today with up to 26% chromium, some with nickel, molybdenum, aluminum, titanium, or manganese depending on the desired properties.

Zamak ingots ready for production.

10.

Materials: steel – mostly iron, with little or no carbon.

Simply speaking, if it is not stainless steel it is carbon steel. Just as there are many different alloys that we call stainless steel there are even more that we call carbon steel. All of them are steel alloys containing nickel, molybdenum, aluminum, titanium, or manganese to name a few. Steel with very low carbon content and some fibrous slag is known as wrought iron. The manufacture of this product – with its beautiful wood-like grain – declined in the 1950's due to the high cost of production. Even though the term wrought iron is often still used in hardware, the material it refers to has been replaced with mild steel (low but not as low as carbon content steel).

As an economical choice certain types of handles like wire pulls can be made of steel and finished in many high-quality finishes, especially powder coating.

A die-casting tool in the making at the Schwinn tool shop.

11.

Materials: plastic – it created a stir at the 1862 International Exhibition in London.

When Alexander Parkes presented this new material he had derived from cellulose and called Parkesine – the first man-made plastic – at the 1862 International Exhibition London, people were fascinated. But Parkesine was expensive, prone to cracking, and highly flammable. A few years later, in 1868, the American inventor John Wesley Hyatt developed a plastic material he named Celluloid improving on Parkes' invention so that it could be processed into finished form. Together with his brother Isaiah, Hyatt patented the first injection-molding machine in 1872, which was quickly used to make things like buttons and combs. Today there are thousands of different plastics that are injection-molded into almost everything including furniture hardware.

An economical choice, injection-molded handles, knobs, legs, and grommets play a big role in the modern furniture industry and Schwinn provides an increasingly large share of innovative products for that market.

12.

Production: die-casting – a process born in the USA.

First invented in 1876 in America by the German Ottmar Mergenthaler for the printing industry, the process of forcing molten metal under high pressure into mold cavities was quickly refined and as a result, it caught on in many industries. Today it is used worldwide to manufacture parts of high-fluidity metal alloys including Zamak, brass, bronze, and magnesium. The parts have excellent dimensional accuracy, smooth cast surfaces (or textured if desired), allow thinner walls when compared to sand cast or permanent mold casting, and great tensile strength which makes it ideal to manufacture complex, high quality, modern design furniture hardware.

However, to produce a perfect part the tool has to be perfect. That's why we have our own Schwinn tool workshop. Highly trained and experienced workers know every important detail of the process and make sure that our furniture hardware is made on the best possible and longest lasting tools.

Die-casting machines in action at a Schwinn factory.

13.

**Production: extruding –
by the inch, foot, or yard.**

Extrusion is a process used to create objects of a fixed cross-sectional profile. A material is pushed or drawn through a die of the desired cross-section that can be as simple as a tube or the complex profile of a furniture handle. Although known since the 18th-century, it was not until the 19th-century and the invention of the hydraulic powered press, that the extrusion process was commonly used for lead, and then late in the 19th-century for copper and brass alloys. Today aluminum is the most commonly extruded material. The two main advantages of this process over other manufacturing processes are the ability to create very complex cross-sections and to work with brittle materials. The finished parts have an excellent surface finish – an important requirement for furniture hardware.

14.

**Production: injection
molding – the era
that started in 1946.**

Injection molding is to thermoplastics what die-casting is to metal. Back in 1872, the American John Wesley Hyatt and his brother invented a machine that basically pushed plastic through a plunger into a mold. But it was in 1946 that the screw injection machine by American James Watson Hendry first allowed precise control over the speed of the process and quality of the produced parts. To this day it is still the most economical way to produce large amounts of parts of an ever-increasing amount of materials and possibilities that we call plastics. As one of the leading suppliers to the furniture industry, Schwinn uses ABS, a tough and recyclable plastic, to produce a broad range of high-quality parts from handles and grommets to furniture legs.

15.

**Finishes: more than
just a pretty face.**

Many desired properties of furniture hardware, such as resistance to abrasion, wear, acidic liquids, and corrosion, as well as color, luster, sheen, and feel are not accomplished by the primary material used to shape the product, but instead by its finish. It is the finish that often makes the difference between good and great; appropriate or inappropriate for a specific purpose or environment; lasting or short lived. There are many finishes to choose from. Their qualities vary greatly and the differences are much deeper than it appears.

16.

Finishes 1: electroplating – what you don't see is what matters.

Technically, electroplating is a process in which metal ions (e.g., nickel, copper, chromium, etc.) in a solution are moved by an electric field to coat an electrode like a piece of hardware. Plating is a non-leveling coating. Any imperfection in the cast piece will show. That means the surface has to be finished and buffed or brushed (if a brushed finish is desired) to perfection first. Schwinn employs highly skilled workers with many years of experience for this critical job. Just as the preparation is important for the appearance of the finished piece, so is the cleaning for its durability.

There is even a standard for that:

ASTM B3222. After all that is done it is time for several rounds of plating.

At Schwinn, we first use a layer of copper, then another layer of copper, then nickel, and finally chromium to achieve our high-quality chrome finish. During this process each part goes through over 40 different baths to ensure perfect and lasting quality.

17.

Finishes 2: anodizing – like nature, only thicker.

Mostly known and used as a finish for aluminum, anodizing increases the thickness of the aluminum oxide layer that is naturally formed when aluminum is exposed to air. With some chemicals, electricity and a well-prepared surface the anodized part gets an oxide layer that will make it highly corrosion resistant. Since this layer is quite porous it can easily absorb dyes allowing for a nice range of colors. The final step is the application of a sealer – a critical step that keeps the dye from discoloring and seals the surface against corrosion.

18.

Finishes 3: powder-coating. High Performance Finish.

Because powder coating uses an electric charge and no solvent it can be applied much thicker than liquid paint. In fact Schwinn powder-coated finishes are 5-10 times thicker than lacquer. After preparing the piece the powder is applied with a spray gun and then cured at around 400F. The result is a beautifully smooth, highly durable finish. Schwinn AM Antimicrobial Protected Furniture Hardware features an innovative high performance finish that inhibits microbial growth adding the value of product protection to the design and quality of Schwinn Hardware. It has proven to resist over 1000 hours of salt spray (ASTM-B117) and over 1000 hours of humidity (ASTM-D2247). With its additional excellent scratch resistance, chemical resistance, and adhesion, our performance finish is setting new standards in the industry. For more information please go to www.schwinnhardware.com.

Schwinn's fully automated, high volume powder coating machine.

The Agion Antimicrobial is not intended as a substitute to good hygiene. It does not protect users or others against disease-causing bacteria. Coated products must still be cleaned to insure the surfaces will be free of destructive microbes. Schwinn Hardware makes no representations or warranties, expressed or implied as to the efficacy of the Agion Antimicrobial. Agion is a registered trademark of Scissent LLC, Wakefield, MA, USA. Cradle to Cradle (CM) is a certification mark of MBDC.

19.

Finishes 4: lacquering. Thin and smooth protection.

An inexpensive way to achieve a smooth protective coating is the application of a clear or colored varnish that dries by solvent evaporation. Schwinn uses only environmentally friendly water based lacquers. Surface preparation, cleanliness, and the quality of the lacquer are of highest importance in achieving a smooth film that lasts over time.

Schwinn's eco-friendly lacquering machine uses only water-based products.

20.

Standards for Hardware.

Product safety and performance, as well as the environmental impact of the production and use of furniture hardware, are regulated by various standards in different industries and countries. One important US standard is ANSI A 156.9.2010 which was developed by the Builders Hardware Manufacturers Association and then adopted by the Kitchen Cabinet Manufacturers Association KCMA. Continuous improvements on all levels make sure that Schwinn products always meet or exceed national and international standards.

LEED. Leadership in Energy and Environmental Design, is the most widely recognized and used green building program across the globe. It is instituted by the United States Green Building Council. LEED is certifying 1.6 million square feet of building space each day in more than 130 countries. LEED is a certification program for buildings, homes and communities that guides the design, construction, operations and maintenance. Nearly 50,000 projects are currently participating in LEED, comprising more than 8.9 billion square feet of construction space. Because handles and knobs are usually less than 5% of the product by weight (e.g., the desk) these parts generally do not contribute to LEED points.

Level. The Level certification process follows the LEED ratings. Instead of being a rating for buildings however it is a rating for all business and institutional furniture manufacturers as well as for the suppliers of materials and components. The implications for furniture hardware like knobs and handles are the same as for LEED.

RoHS. Restriction of Hazardous Substances, was adopted by the European Union in 2003 and took effect in 2006. Lead, Mercury, and Hexavalent Chrome are three of the six substances that are targeted and relevant to furniture hardware components. Maximum permitted concentrations are 1000ppm. Schwinn products are in compliance with RoHS.

21.

ADA considerations.

The Americans with Disabilities Act (ADA) is the most comprehensive civil rights legislation adopted to prohibit discrimination against people with disabilities. The ADA was signed into law on July 26, 1990.

Title III prohibits discrimination by private entities and nonprofit service providers operating public accommodations. This includes privately operated entities that offer licenses and exams, private schools and colleges, banks, restaurants, theaters, hotels, private transportation, supermarkets, shopping malls, museums, health clubs and other recreational facilities, sports arenas, doctor, lawyer and insurance offices, and other commercial facilities.

Public accommodations must not exclude, segregate or treat people with disabilities unequally. This includes compliance with architectural standards providing physical access.

Guidelines. Drawer handles fall under section 4.25.4 of the ADA Standards for Accessible Design as hardware for storage facilities. "4.25.4 Hardware. Hardware for accessible storage facilities shall comply with 4.27.4. Touch latches and U-shaped pulls are acceptable." Further detail comes from section 4.27.4: "Controls and operating mechanisms shall be operable with one hand and shall not require tight grasping, pinching, or twisting of the wrist. The force required to activate controls shall be no greater than 5 lbf." Based on these guidelines we have noted for each item in this catalog whether or not we consider it in compliance with ADA.

Schwinn Item 3793/32 Tab Pull

Material: Aluminum

Environmental Information:

- Fully Recyclable
- Meets RoHS Standards

ADA Compliant: No

51 x 20 x 36 mm

General Information

1.

Terms: Net 30 days on established credit.

2.

Shipping and handling: all orders are shipped FOB Scottsdale, Arizona. Standard service level is ground shipping. Fees apply. Third party and rush shipping available. Please provide account number and specify service level. Drop shipment available upon request.

3.

Returned goods: merchandise may be returned only with our approval within 30 days of receipt of merchandise. A Schwinn issued RGA number must accompany all returns. Returns must be sent freight prepaid unless we have agreed in writing to issue a call tag.

4.

Minimum order: one (1) piece. A \$10.00 handling fee applies to orders valued at less than \$50.00 net.

5.

Samples: up to three samples (three different items) are provided free of charge. Shipping charges apply. Sample orders from \$25.00 to \$50.00 net will be memo invoiced and credited to a subsequent order of \$250.00 or more placed within 90 days. Sample orders of \$50.00 or more will be invoiced at suggested retail prices minus applicable discount.

6.

Prices: prices in this catalog are suggested retail prices per piece and are subject to change without notice.

7.

Claims: shortages, damages or discrepancies between ordered and received items of any kind must be reported to Schwinn within 48 hours from the date the shipment was received. Schwinn is not responsible for damage to merchandise caused by the delivery carrier.

8.

Our craftsmen and finish experts strive to maintain consistent quality in all of our products. Variations in finish color, sheen, and texture occur naturally and do not constitute a defect. The specific range of variation depends on the finish process and material. We do not guarantee the match of a finish to a sample, different model, or different production runs.

Leather is a natural product from animal hides and therefore differs from hide to hide. Variations in the texture of the leather should not be considered a fault but inherent of the natural beauty and uniqueness of the leather. As every piece of leather is different and may accept dyes a little differently during the tanning process, this may cause irregularities in the consistency and depth of the color. Markings such as dents, scars, scratches, wrinkles or blemishes occur naturally in leather. These irregularities should not be considered as a defect but rather indications of genuine leather.

Stainless steel grade 303, the grade commonly used in cabinet hardware for its machinability, should not be exposed to marine or other similar environments, as this will result in rapid pitting corrosion. Schwinn Performance Finish products provide maximum corrosion resistance, chemical resistance, as well as abrasion resistance in addition to their antimicrobial properties.

9.

Warranty: Schwinn warrants that its products are free from defects in workmanship and materials. Schwinn is not responsible for failure due to incorrect installation, failure to follow mounting instructions or use of product in a manner for which it was not designed. Failure due to abuse, misuse or accident, any failure due to dismantling, alteration, or repair by any person not authorized by Schwinn. Failure due to incorrect maintenance. Fair wear and tear. Cost of removal, installation and freight. Deterioration and discoloring of finishes over time due to climate conditions.

10.

Liability: Schwinn's liability hereunder is limited to the purchase price of the product. In no event shall Schwinn be liable for any consequential, indirect, incidental or special damages of any nature arising from the sale or use of the product, whether in contract, tort, strict liability or otherwise.

11.

Screws: all our handles and knobs require the use of metric screws. If "cut-off" screws are used: these screws can be cut at specific increments to accommodate the most common panel thicknesses. Please use end cutting or side cutting pliers and cut at specific increments only. Improperly cut screws will damage the tapping in the handle or knob.

12.

Care of hardware: please use a damp, non-abrasive cloth or sponge and mild soap only.

13.

Displays: a high quality display program for showrooms with sample boards for wall or free-standing presentation is available upon request.
